ELISA kits available from ADI:

**Human:** Adiponectin (Acrp30 and gAcrp30), Albumin, Aldosterone, AFP, beta-amyloid 1-40/42, Angiogenin, Angiopoietin-2, beta-2M, BMP-7, C-peptide, CRP, Cox-2, Ferritin, PSA, fPSA, GH, IgG, IgM, IgE, IgG1, IgG4, Insulin, NSE, CA125, CA199, CA242, PAP, Resistin, SHBG, LH, FSH, TSH, T3, T4, and Steroid ELISA kits (cortisol, estradiol, testosterone, progesterone).

**Monkey:** IgM, IgG, IgA, IgE

**Rat:** Albumin, CRP, IgG, IgM, Alpha-1 Acid glycoprotein

**Mouse:** Albumin, IgA, IgG, IgG1, IgG2a, IgG2b, IgG3, IgE, IgM, Leptin, Resistin, Acrp30, CRP, Haptoglobin, TNF-alpha

**Autoimmune** Antibody detection kits for ANA, ssDNA, dsDNA, Histone, Sm, RNP, SSA, SSB, ScI70, Ovalbumin, Cardiolipin, CIC

**Chicken:** IgG, IgM, IgY, Ovalbumin

**Turkey:** IgG

**Bovine:** Albumin, IgG, IgM, Lactoferrin, Transferrin

**Pig:** Albumin, IgG, IgM

**Dog:** CRP, IgG, IgM

**Cat:** IgG, IgM

**Goat:** IgG

**Rabbit:** CRP, IgG

**Sheep:** IgG

See Details at the web site or Contact ADI
**Intended Use**

ADI mouse CRP ELISA kit is intended to measure CRP concentration in mouse serum, plasma or other biological fluids. This kit is for in vitro research use only (RUO).

**INTRODUCTION**

C-reactive protein (CRP) has been regarded as an acute phase reactant in serum (1). It consists of five single subunits, which noncovalently linked and assembled, as a cyclic pentamer with a mol. Wt. Range of 110-140 kDa (2). CRP has been found to be increased in serum of patients with a wide variety of diseases including infections by gram-positive and gram-negative bacteria (3), acute phase of rheumatoid arthritis (4), abdominal abscesses, inflammation of bile ducts (4), myocardial infarction (4, 5), and malignant tumors (6, 7). CRP may be found in patients with Guillain-Barre syndrome and multiple sclerosis (8), certain viral infections (6, 9), tuberculosis (4, 7), acute infectious hepatitis (6), many other necrotic and inflammatory diseases, burned patients, and after surgical trauma (4). Although the detection of elevated levels of CRP in the serum is not specific for any particular disease, it is useful indicator of inflammatory processes. CRP levels rise in serum within hours of the onset of inflammation, reach a peak during the acute stage and decrease with resolution of inflammation trauma. The detection of CRP is a more reliable and sensitive indicator of the inflammatory process than the erythrocyte sedimentation rate, which may also be influenced by physiological changes not associated with an inflammation process. Current quantification methods including latex agglutination, nephelometry, and radial immunodiffusion have the general disadvantage accompany agglutination and precipitation techniques (10).

**PERFORMANCE CHARACTERISTICS**

**Detection Limit:** Based on 6 replicate determinations of the zero standards, the minimum CRP concentration detectable using this assay is ~2.0 ng/ml. The detection limit is defined as the value deviating by 2 SD from the zero standard.

**Expected Values:** A limited testing of 20 adult mouse serum samples produced values of 4 -14 ug/ml (average 6.5 ug/ml).

**Sample Dilution**

5 mouse serum (BALB/C) were 2-fold serially diluted from 1:50 -1600 and tested for CRP. Samples values were 2.44, 2.80, 6.19, and 9.87, 18.19 ug/ml with CV% 2.5-14%.

**Species Crossreactivity**

Cross reactivity was tested with the following CRP proteins at 100 ng/ml: Rat CRP showed >200% reactivity, and human CRP showed ~10% reactivity. Monkey, rabbit and dog CRP all showed less than 1% cross reactivity. The following sera showed less than 1% reactivity when diluted at 1:100: bovine, FBS, hamster, guinea pig, rat, sheep, chicken, pig and goat.

**NOTE:** These data are for demonstration purpose only. A complete standard curve must be run in every assay to determine sample values. Each laboratory should determine their own normal reference values.

**A typical assay Standard Curve (do not use this for calculating sample values)**

---

**PRINCIPLE OF THE TEST**

Mouse CRP ELISA kit is based on binding of Mouse CRP from samples to two antibodies, one immobilized on the microtiter well plates, and other conjugated to the enzyme horseradish peroxidase. After a washing step, chromogenic substrate is added and colors developed. The enzymatic reaction (color) is directly proportional to the amount of CRP present in the sample. Adding stopping solution terminates the reaction. Absorbance is then measured on a microtiter well ELISA reader at 450 nm. and the concentration of CRP in samples and control is read off the standard curve.

**MATERIALS AND EQUIPMENT REQUIRED**

Adjustable micropipet (5-1000 ul) and multichannel pipet with disposable plastic tips. Reagent troughs, plate washer (recommended) and ELISA plates Reader.

**PRECAUTIONS AND SAFETY INSTRUCTIONS**

The Mouse CRP ELISA Kit is for research use only. Stop Solution contains 1% sulfuric acid. Follow good laboratory practices, and avoid ingestion or contact of any reagent with skin, eyes or mucous membranes. All reagents may be disposed of down a drain with copious amounts of water.

Applicable MSDS, if not already on file, for the following reagents can be obtained from ADI or the web site.

**SPECIMEN COLLECTION AND HANDLING**

Collect blood by venipuncture, allow clotting, and separating the serum by centrifugation at room temperature. Do not heat inactivate the serum. If sera can not be immediately assayed, store frozen for up to six months. Avoid repeated freezing and thawing of samples. It is also possible to use plasma for testing.

**REAGENT PREPARATION**

1. The Wash Buffer is a 20x stock. Dilute the entire 50ml with distilled or deionized water to 1 L total volume. Store at room temperature for the entire use of the kit.

2. Mouse CRP standard preparation: It is supplied in powder and it is reconstituted in 0.2 ml water to give approx.. 5000 ng/ml (exact conc are lot specific). It is further diluted to prepare testing standards of 100-1.56 ng/ml in 2-fold serial dilutions (see dilution scheme on page 3).

3. **STORAGE AND STABILITY**

The microtiter well plate and all other reagents, if unopened, are stable at 2-8°C until the expiration date printed on the label. After opening the kit components, the shelf life is approximately 2 months.
TEST PROCEDURE (ALLOW ALL REAGENTS TO REACH ROOM TEMPERATURE BEFORE USE).

1. Reconstitute lyophilized Reference Standard with 200uL of distilled water. Follow the stock concentration preparation on the vial to prepare stock mouse CRP of 100 ng/ml. (Stock concn is lot specific and the reconstitution volume and stock concn is provided for each lot). Store unused Reference Standard at -20°C.

2. Prepare other standards using the following dilution of 100 ng/ml (prepare in step 1) stock scheme: Prepare at least 250 ul of each std to run in duplicate (100 ul/well)

Mouse serum samples dilution: Mouse CRP in serum is 2.5-20 ug/ml. So dilute samples 1:200 (2.00 ul serum in 398 ul diluent; it is better to take 5-10 ul sample if available for better precision). Samples that are too low or high should be tested at appropriate dilution. Do not test samples at dilution less than 1:25 to minimize background.

3. Label or mark the microtiter well strips to be used on the plate.

4. Pipet 100 ul standards and diluted samples in duplicate into appropriate wells.

Note: for ease of loading samples it is recommended that a second uncoated microwell plate should be used keeping diluted samples. This enables standards or samples to be transferred quickly to the ELISA plate using multichannel pipette.

5. Mix gently, and incubate on at orbital micro-plate shaker at 150 rpm at room temp. (18-25 oC) for 45 minutes

6. Wash the wells 5 times with 400 ul of 1x wash buffer.

7. Pipet 100 ul of Antibody-enzyme conjugate into each well. Mix gently, and incubate on at orbital micro-plate shaker at 150 rpm for 45 minutes at room temperature.

8. Aspirate and wash the wells 5 times with 1x wash buffer. We recommend using an automated ELISA plate washer for better consistency. Failure to wash the wells properly will lead to high blank or zero values. If washing manually, plate must be tapped over paper towel between washings to ensure proper washing.

9. Add 100 ul of TMB Substrate into each well. Mix gently. Cover the plate and incubate on plate shaker at 150 rpm for 20 minutes at room temperature. Blue color develops.

10. Stop the reaction by adding 100 ul of stop solution to all wells. Mix gently. Blue color turns yellow.

11. Measure the absorbance at 450 nm using an ELISA reader. Color is stable for at least 30 minutes after stopping.

NOTES: Read instructions carefully before the assay. Do not allow reagents to dry on the wells. Careful aspiration of the washing solution is essential for good assay precision. Since timing of the incubation steps is important to the performance of the assay, pipet the samples without interruption and it should not exceed 5 minutes to avoid assay drift. If more than one plate is being used in one run, it is recommended to include a standard curve on each plate. The unused strips should be stored in a sealed bag at 2-8°C. Addition of the HRP substrate solution starts a kinetic reaction, which is terminated by dispensing the stopping solution. Therefore, keep the incubation time for each wells the same by adding the reagents in identical sequence. Plate readers measure absorbance vertically. Do not touch the bottom of the wells.

DIILUTION OF SAMPLES

Samples containing more than 100 ng/ml CRP should be further diluted and re-tested. The results obtained should be multiplied by the appropriate dilution factor. It is possible to use normal saline or PBS for sample dilution if larger volumes of samples are taken for dilution or if more sample diluent is required.

CALCULATION OF RESULTS

Calculate the mean absorbance for each duplicate. Draw the standard curve on linear graph paper by plotting net absorbance values of standards against appropriate CRP concentrations. Read off the CRP concentrations of the control and patient samples. Multiply the values by the dilution factor of the samples. If samples were diluted 1:500 then the values must be multiplied by 500 and results are expressed as mg/ml.
